

# Structural balance in complex networks

Observation, Emergence, and Implications

Dr. Giacomo Vaccario

# Objectives of the review

- ▶ Clarify **consistency** of measures
  - ▶ Link to network structure
  - ▶ Catalogue of null models
- ▶ Theoretical **drivers**
  - ▶ Simultaneous Vs Alternative
  - ▶ Reinforcement Vs Weakening
- ▶ Practical **implications**
  - ▶ Ideological polarization
  - ▶ Performance, persistence, resilience, ...

Introduction

Observation

Emergence

Implications

# Structural balance (SB)

## Original definition [Heider 1946]

- ▶ nodes → 2 individuals and 1 object
- ▶ edges → *signed* relations
- ▶ even number of negative links → balance

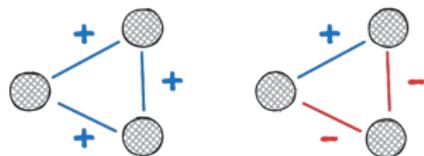

## Extension to social networks [Cartwright & Harary 1956]

- ▶ nodes → *only* individuals
- ▶ edges → *signed* relations

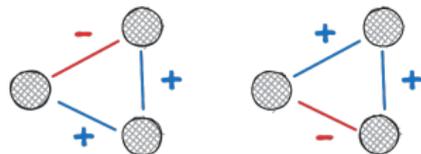

micro-level → **triads**

macro-level → **Paradise** or **Polarization**

### Balanced

### Un-Balanced

## Why do we care about SB

- ▶ micro-macro link → **Emergence**
- ▶ very different balanced states → **Functionality** of networks
- ▶ **Applications** in social sciences, economics, ecology, biology, ...

# Structural balance (SB)

- ▶ very different balanced states → **Functionality** of networks
- ▶ **Applications** in social sciences, economics, ecology, biology, ...

Introduction

Observation

Emergence

Implications

# What do we need to measure SB?

## Data $(N, E)$

- ▶ **Nodes**  $\rightarrow$  system elements  $i \in N$ 
  - ▶ individuals
  - ▶ objects
  - ▶ groups
  - ▶ ...
- ▶ **Links**  $\rightarrow$  signed relations,  $(i, j, s) \in E$ 
  - ▶  $s \in \{0, 1\} \rightarrow$  binary  $\rightarrow$  positive, negative
  - ▶  $s \in \{x, \dots, 0, \dots + x\} \rightarrow$  discrete  
 $\rightarrow$  very negative to very positive [Harary 1959]
  - ▶  $s \in [a, b] \subset \mathbb{R}$  continuous

## Measure $f$

- ▶ **Node + links**  $\rightarrow$  signed networks  $G(N, E)$
- ▶  $f : G(N, E) \rightarrow \{0, 1\} \equiv$  full balance or unbalanced
  - ▶  $A \rightarrow$  adjacency matrix
  - ▶  $f : A \rightarrow \{0, 1\}$
- ▶ **Partial** balance  $\rightarrow f : \cdot \rightarrow [a, b] \in \mathbb{R}$

# Observation of structural balance: Data (N,E)

## Direct signed relations

- ▶ Social networks
  - ▶ surveys → small scale
  - ▶ online → large scale
  - ▶ negative links are rare
- ▶ Ecology and chemistry
  - ▶ mutualistic VS predator-prey
  - ▶ activator VS inhibitor
- ▶ ...

## Inferred signed relations

- ▶ Social interaction data
  - ▶ text edits → wikipedia, github, ...
  - ▶ co-location → face-to-face, ...
  - ▶ communication → email, phone, ...
- ▶ Others
  - ▶ co-activation → brain, ...
  - ▶ correlation → stock market, ...
- ▶ ...

## Data challenge

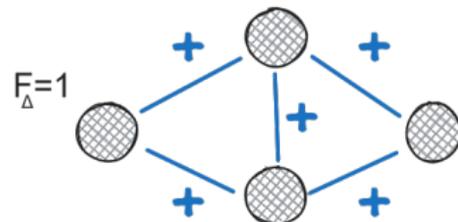

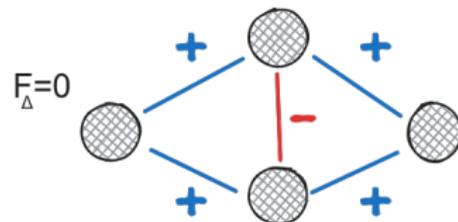

- ▶ **Signed relations** more scarce → **Interaction** data is largely available
- ▶ Methods are needed to infer signed relations, examples based on:
  - ▶ network ensemble [Andres et al., 2022], thresholds [Fraxnet et al., 2023; Wutchy and Uzzi., 2011]

## Measures of partial balance $f$

- ▶ **Structural measures** → look at the adj.  $A$ 
  - ▶ Fraction of balanced triads  $F_{\Delta}$  [Terzi and Winkler 2011]
    - ▶ simple and quick
  - ▶ Fraction of balanced cycles [Cartwright and Harary 1956]
    - ▶ longer paths → less important [Estrada and Benzi 2014]
- ▶ **Extremisation** → How far away from **full balance**
  - ▶ min. number of sign changes → line index [Harary 1959]
  - ▶ min. number of nodes expelled → point index [Harary 1959]

### SB depends on the measure

- ▶ **Details** of the network matter!
- ▶ Different measure → different results → trivial, but..
- ▶ Need for **reference** values to interpret results

# Building reference cases: Null models

Null model → **random** object that **preserves** some properties:

**NM1** Number of positive link → preference to form positive links

- ▶ if  $f(G(N,E)) \neq \langle f(G(N,E')) \rangle$   
⇒ evidence for/against (partial) balance

**NM2** Signed degree distribution → preference and heterogeneity

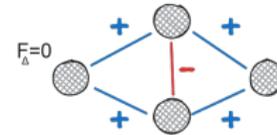

- ▶ if  $f(G(N,E)) \sim \langle f(G(N,E')) \rangle$   
⇒ partial balance due to the signed degree distribution

**NMX** ...

## Signed structure and SB

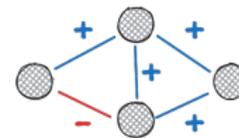

- ▶ Different null models → different results → trivial, **but..**
- ▶ How to choose the null models? [Gallo et. al, 2024]
- ▶ Null models → hypothesis testing
- ▶ Generative mechanisms → emergence of SB

Null model 1 (NM1)

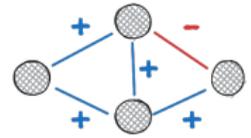

Original

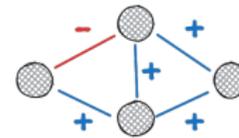

Re-shuffled

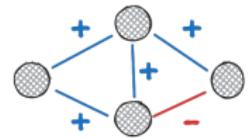

$F_{\Delta}=0.5$

$F_{\Delta}=0.5$

$F_{\Delta}=0.5$

$F_{\Delta}=0.5$

$$\langle F_{\Delta} \rangle_{NM1} = (0.5 \times 4 + 0) / 5 = 0.4$$

## Building reference cases: Null models

Null model → **random** object that **preserves** some properties:

**NM1** Number of positive link → preference to form positive links

- ▶ if  $f(G(N,E)) \neq \langle f(G(N,E')) \rangle$   
⇒ evidence for/against (partial) balance

**NM2** Signed degree distribution → preference and heterogeneity

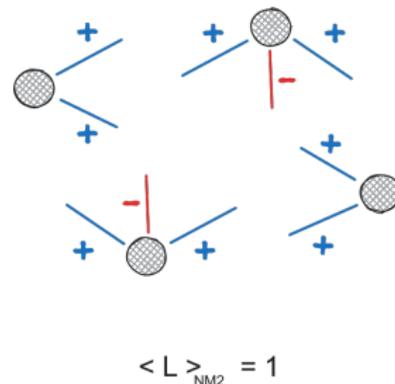

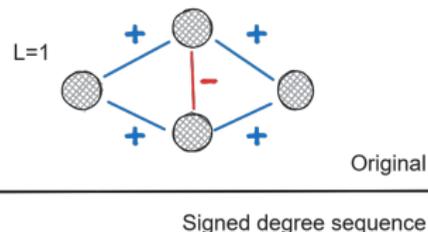

- ▶ if  $f(G(N,E)) \sim \langle f(G(N,E')) \rangle$   
⇒ partial balance due to the signed degree distribution

**NMX** ...

### Signed structure and SB

- ▶ Different null models → different results → trivial, **but..**
- ▶ How to choose the null models? [Gallo et. al, 2024]
- ▶ Null models → hypothesis testing
- ▶ Generative mechanisms → emergence of SB

Null model 2 (NM2)

Introduction

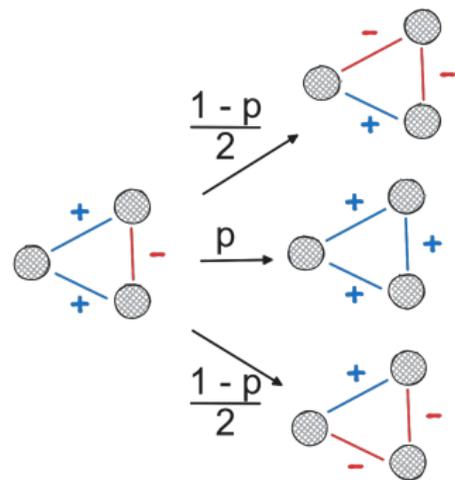

Observation

**Emergence**

Implications

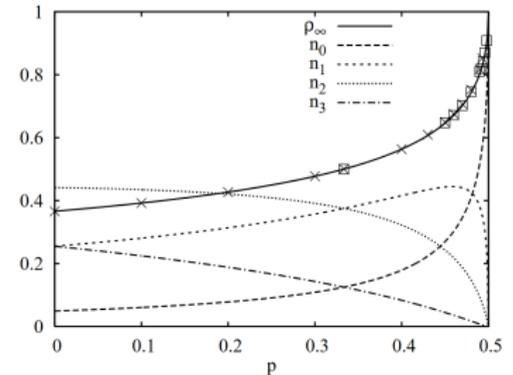

# Emergence of structural balance

- ▶ **Generative mechanisms** → explain the emergence of SB
  - ▶ cognitive dissonance [Heider 1946]
  - ▶ homophily [Pham et al. 2022]
  - ▶ biotic interactions [Saiz et al. 2016]
  - ▶ in-group praise Vs out-group derogation [Wojcieszak et al. 2021]
- ▶ **Phase transition** → from disorder to order [Macy et al. 2021]
  - ▶ Parameters → **Order** and **Control**
  - ▶ Continuous, first order, hysteresis, bifurcation
- ▶ **Example** of sign dynamic [Antal et al. 2005]
  - ▶ Control → probability to form positive ties  $p$
  - ▶ Order → number of balanced triads  $F_{\Delta}$
  - ▶ Continuous phase transition at  $p = 0.5$

# Emergence of structural balance

- ▶ **Generative mechanisms** → explain the emergence of SB
  - ▶ cognitive dissonance [Heider 1946]
  - ▶ homophily [Pham et al. 2022]
  - ▶ biotic interactions [Saiz et al. 2016]
  - ▶ in-group praise Vs out-group derogation [Wojcieszak et al. 2021]
- ▶ **Phase transition** → from disorder to order [Macy et al. 2021]
  - ▶ Parameters → **Order** and **Control**
  - ▶ Continuous, first order, hysteresis, bifurcation
- ▶ **Example** of sign dynamic [Antal et al. 2005]
  - ▶ Control → probability to form positive ties  $p$
  - ▶ Order → number of balanced triads  $F_{\Delta}$
  - ▶ Continuous phase transition at  $p = 0.5$

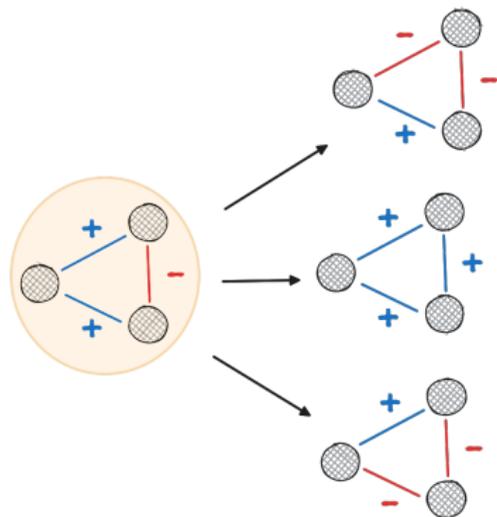

[Antal et al. 2005]

# Emergence of structural balance

- ▶ **Perspective** → Who or what changes the signs
  - ▶ triad [Antal et al. 2005]
  - ▶ dyad [Yap & Arrigan 2015]
  - ▶ ego [Gorski et al. 2024]
- ▶ **Sign dynamics** → How signs change
  - ▶ stochastic [Antal et al. 2005]
  - ▶ deterministic [Kulakowski et al. 2005; De Pasquale et al. 2022]

## Energy landscape $H$

- ▶ Hamiltonian formalism [Marvel et al. 2009]
- ▶ Ragged vs smooth landscapes
- ▶ Accessibility of balanced states

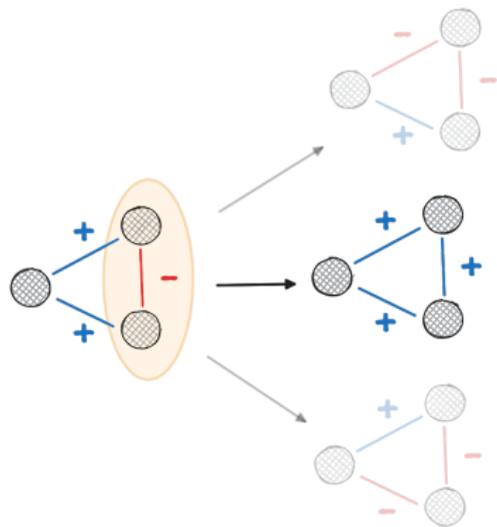

# Emergence of structural balance

- ▶ **Perspective** → Who or what changes the signs
  - ▶ triad [Antal et al. 2005]
  - ▶ dyad [Yap & Arrigan 2015]
  - ▶ ego [Gorski et al. 2024]
- ▶ **Sign dynamics** → How signs change
  - ▶ stochastic [Antal et al. 2005]
  - ▶ deterministic [Kulakowski et al. 2005; De Pasquale et al. 2022]

## Energy landscape $H$

- ▶ Hamiltonian formalism [Marvel et al. 2009]
- ▶ Ragged vs smooth landscapes
- ▶ Accessibility of balanced states

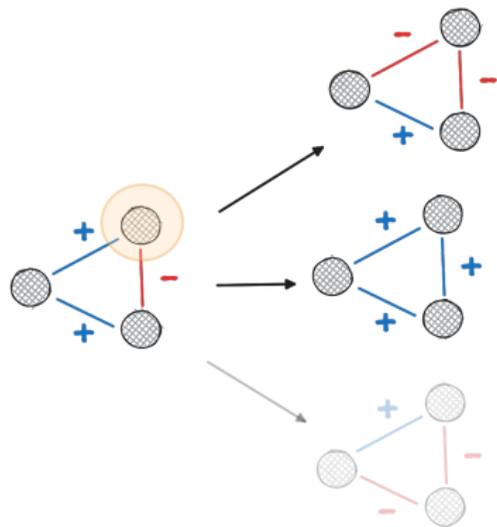

# Emergence of structural balance

- ▶ **Perspective** → Who or what changes the signs
  - ▶ triad [Antal et al. 2005]
  - ▶ dyad [Yap & Arrigan 2015]
  - ▶ ego [Gorski et al. 2024]
- ▶ **Sign dynamics** → How signs change
  - ▶ stochastic [Antal et al. 2005]
  - ▶ deterministic [Kulakowski et al. 2005; De Pasquale et al. 2022]

## Energy landscape $H$

- ▶ Hamiltonian formalism [Marvel et al. 2009]
- ▶ Ragged vs smooth landscapes
- ▶ Accessibility of balanced states

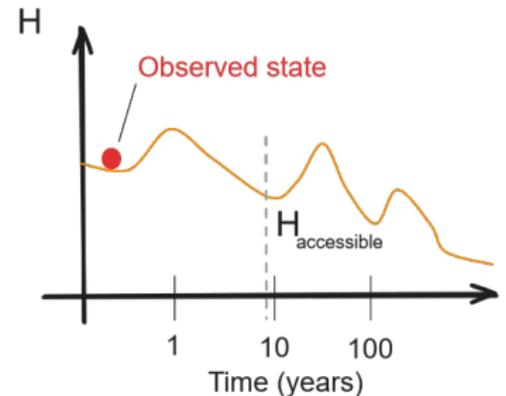

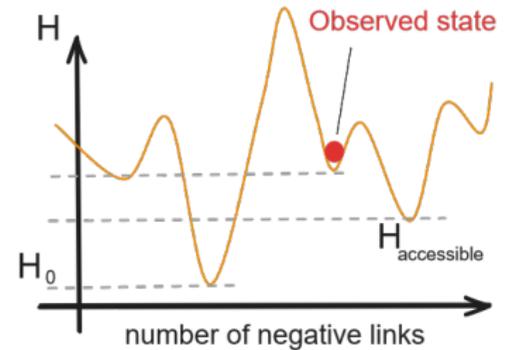

# Models as new measures for SB

- ▶ **Usually** → models simulate sign dynamics
- ▶ **Interesting** → difference between real-world and simulations
  - ▶ How far are the **accessible and more balanced** states?
  - ▶ Partial balance as path dependence
- ▶ Define **measure** for this
  - ▶ **Energy** landscape →  $\Delta H_{SB}$  [Facchetti et al. 2011]
  - ▶ **Time** to reach balance → e.g., first passage time

## Possible research directions

- ▶ **Link** models to SB measures
- ▶ Use dynamics to **interpret** partial balance

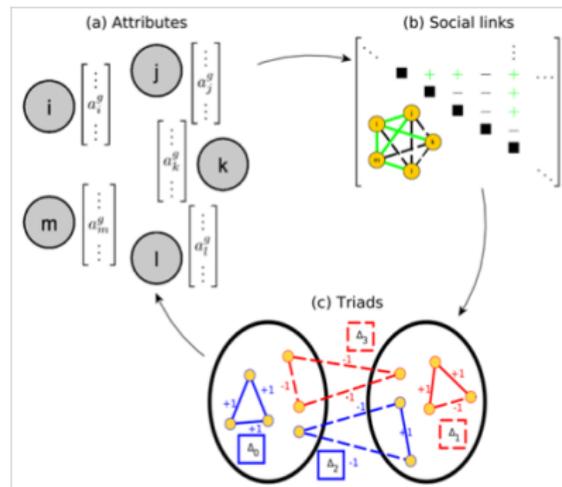

# Richer dynamics: Coupling sign dynamics with node attributes

- ▶ **Node attributes** → opinions, ideology, demographics, ...
- ▶ **Attributes** → **signed links**
  - ▶ homophily (selection), status, ...
- ▶ **Sign links** → **attributes**
  - ▶ homophily (influence), evolutionary fitness, ...
- ▶ Coupling the two → **feedback**: reinforcement or competition

## Modeling SB and node attributes

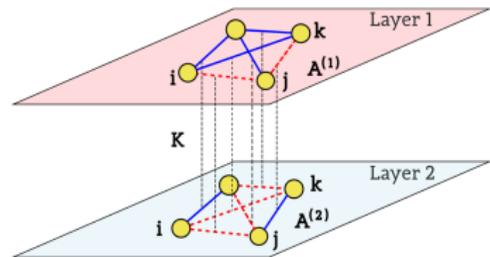

- ▶ Vast literature → **strong focus** on homophily
  - ▶ reproduce degree of balance [Pham et al. 2022]
  - ▶ ordered attributes → avoid polarization [Gorski et al. 2023]
  - ▶ ...
- ▶ Real-world → **multiple simultaneous** mechanisms
- ▶ **Challenge**: connect mechanisms in a interpretable way

[Gorski et al. 2023]

# Structural balance: beyond networks

- ▶ **Relations in different settings** → multilayer networks
  - ▶ layer → environment, time [Mucha et al. 2010], etc.
  - ▶ each layer → different mechanisms
  - ▶ new paths to balance [Krishnadas et al. 2024]
- ▶ **Group relations** → higher-order models [Scholtes et al. 2019]
  - ▶ group interactions → group chats, emails [Battiston et al. 2021]
  - ▶ majority → beyond dyadic-rules [Papanikolaou et al. 2022]

## What is there and what is missing

- ▶ Structural balance in multilayer networks → formal models exist [Krishnadas et al. 2024]
  - ▶ empirical validation is still missing
- ▶ Many formal higher-order models
  - ▶ none tailored to analyze structural balance
  - ▶ very little empirical analysis → missing data [Andres et al. 2024]

Introduction

Observation

Emergence

**Implications**

# Implications of structural balance: Politics

## Trends in the literature

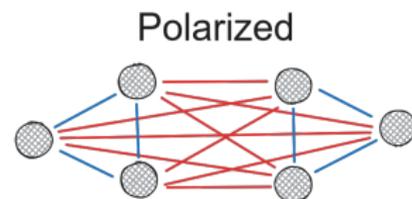

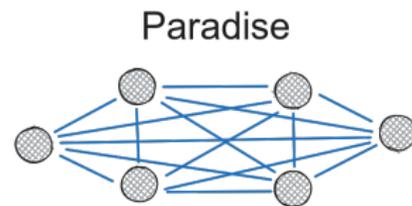

- ▶ increasing **ideological** polarization [Flamino et al. 2023]
- ▶ increasing **elite** polarization [Druckman et al. 2013]
- ▶ decreasing in international relations [Doreian et al. 1996]
- ▶ increasing in international relations [Aref ?]

## Possible **negative** effects

- ▶ "us versus them" [McCoy & Somer 2018]
- ▶ health of individuals [Fraser et al. 2022]
- ▶ increasing governments shutdowns [Jidalini & Smith 2019]

## Possible **positive** effects

- ▶ "lifeblood of democratic politics" [Lipset 1959]
- ▶ quicker government formation [Fontan & Altafini 2021]
- ▶ slower diffusion of fake news [Flamino et al. 2023]

## Ideological polarization

**Duality:** When it is good and when it is bad?

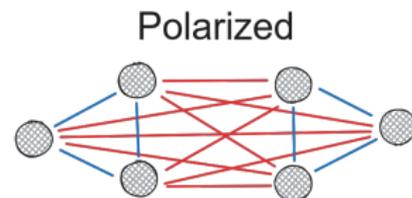

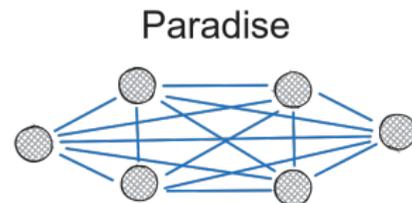

# Implications of structural balance: Functionality

## Possible **negative** effects

- ▶ focus on polarizing triads
- ▶ lower quality of articles [Lerner & Lomi 1019]
- ▶ shorter group persistence [Andres 2024]

## Possible **positive** effects

- ▶ group effectiveness [Morrissette et al. 1967]
- ▶ performance in risky decision-making [Askarisichani et al. 2019]
- ▶ cohesion and longer group persistence [Andres 2024]
- ▶ robust opinion formation [Medo et al. 2021]
- ▶ legislative effectiveness [Aref & Neal 2020]
- ▶ link formation [Leskovec et al. 2010; Huang et al. 2013]

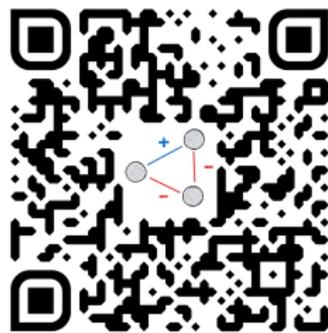

## Mostly positive effects

Focus on **group** performance and resilience

# Objectives of the review

- ▶ Clarify **consistency** of measures
  - ▶ Link to network structure
  - ▶ Catalogue of null models
- ▶ Theoretical **drivers**
  - ▶ Simultaneous Vs Alternative
  - ▶ Reinforcement Vs Weakening
- ▶ Practical **implications**
  - ▶ Ideological polarization
  - ▶ Performance, persistence, resilience, ...
